Did you know?

Stress Can Cause Hair Turn White

The COVID-19 pandemic may be stressful for people in health, living and income. Anyway, there is rising demand for at-home hair coloring products during this pandemic. Do you know stress can cause hair to lose pigment and turn white? In general, men and women hair can go grey any time from their mid-30s. Although, it is mostly due to the natural aging process and genes, stress can also play a role. The BBC news agency showed the experiments on mice models, stem cells that control skin and hair color became damaged after intense stress which turned the mice completely white within weeks. It is explained that pain in mice triggers the release of adrenaline and cortisol, making their hearts beat faster and blood pressure

rise. This affected nervous system and caused acute stress. This process then sped up the depletion of stem cells that produced melanin in hair follicles. After just a few days, all of the pigment-regenerating stem cells were lost and could not regenerate pigment any more. Moreover, this damage is permanent. Stress affects human mental and physical health while everyone wants to have good health and appearance. So, we should relieve stress and anxiety for a good health life.
